No Roll Models

The bike map that routes San Francisco for safety, not just speed

Real city crash data · our own router · AI you can talk to

IMPACT

Bike danger is concentrated — so route around it

1,103

cyclists killed on US roads in 2024

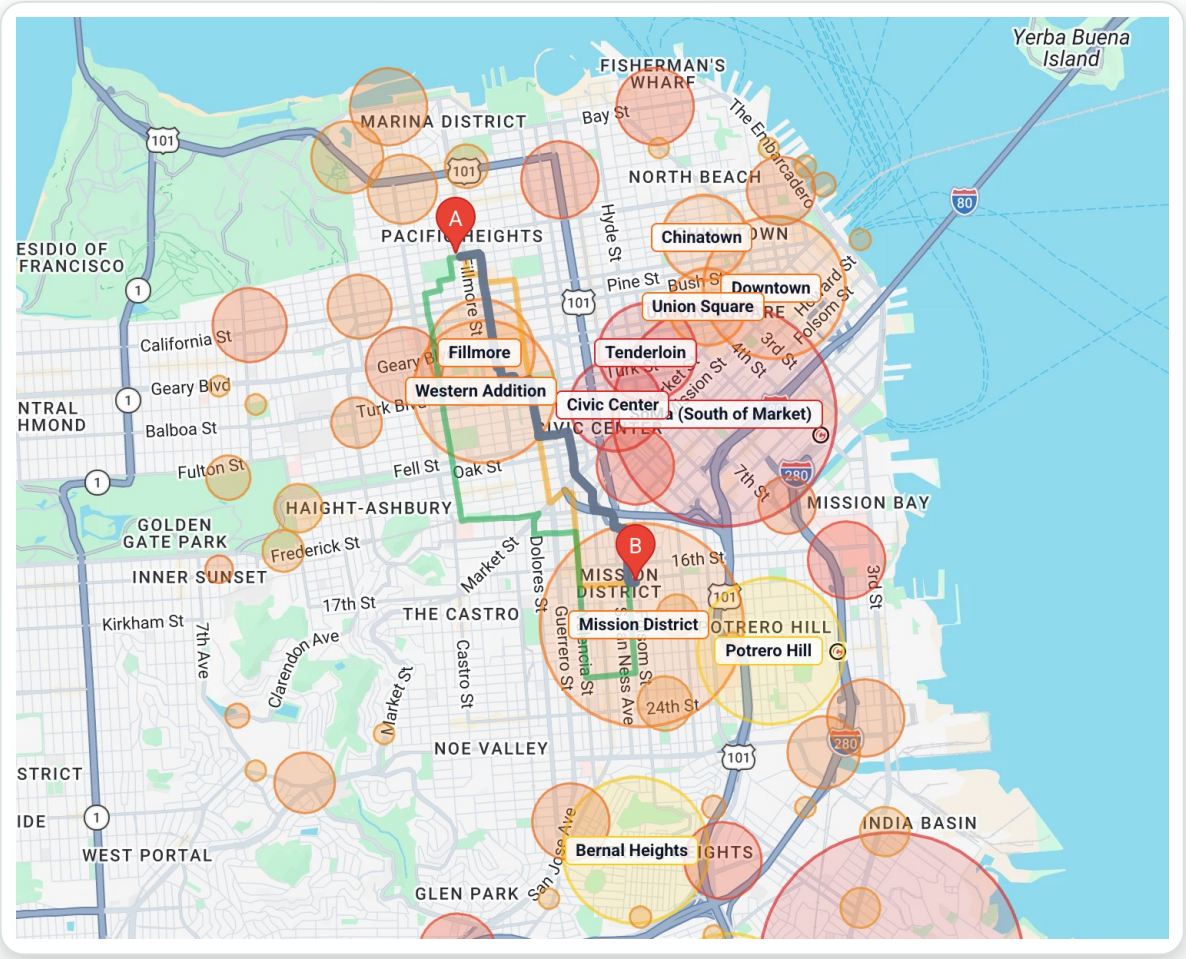

52,887

cyclists injured in 2024 — up 6% from 2023

4% → 55%

4% of SF street miles hold 55% of severe and fatal bike injuries

Sources: NHTSA Traffic Safety Facts, 2024 Data: Bicyclists; SFMTA Vision Zero High Injury Network (cyclist corridors)

Fastest route, Pacific Heights → Mission: more than half the ride inside flagged areas

PRACTICAL

Our own bike router, built on SF's real data

3,558
real bike-injury crashes (DataSF, 2019+)

5,457
SFMTA-surveyed bike-lane segments

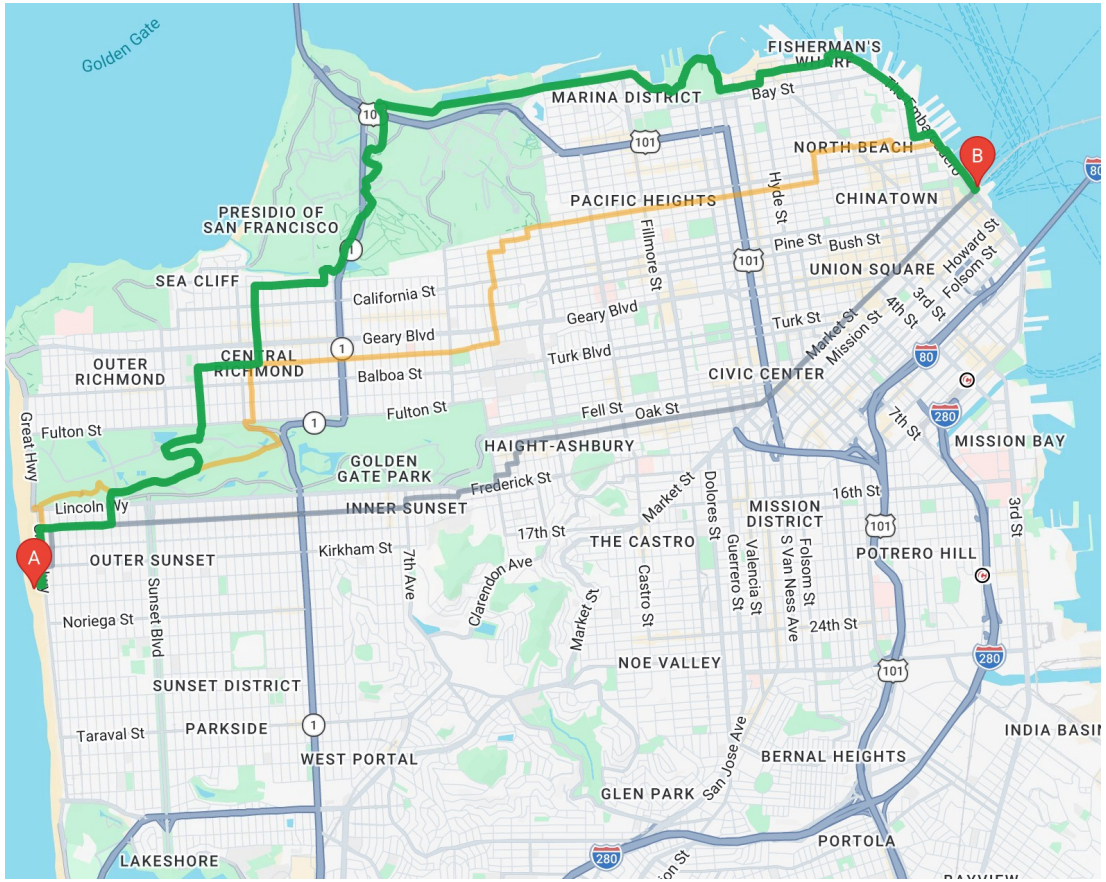

5,566
highways and fast arterials scored

1,314
traffic signals that stop a rider

Every corner
terrain elevation, so hills are real

177,023
LiDAR-measured buildings for 3D

→ a 211,000-segment street graph, searched in about 0.1 s per trip

One trip, three honest options: **Fastest** · **Safest** · **Safest + bike lanes**

Live demo

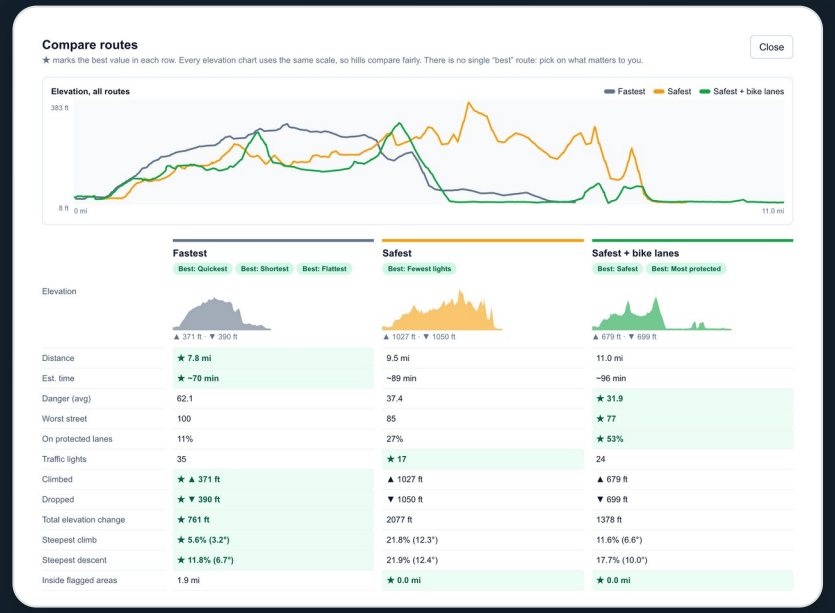

1. **Pacific Heights → 17th & Mission**
   Fastest route + Neighborhood view: the problem, live

2. **Ocean Beach → Ferry Building**
   Safest + bike lanes: what it avoided, what it cost

3. **Turn on Avoid hills**
   Steepest climb 21.8% → 8.6%, and 7 min quicker

4. **Ask the assistant**
   "Flat ride please, with boba and a park on the way"

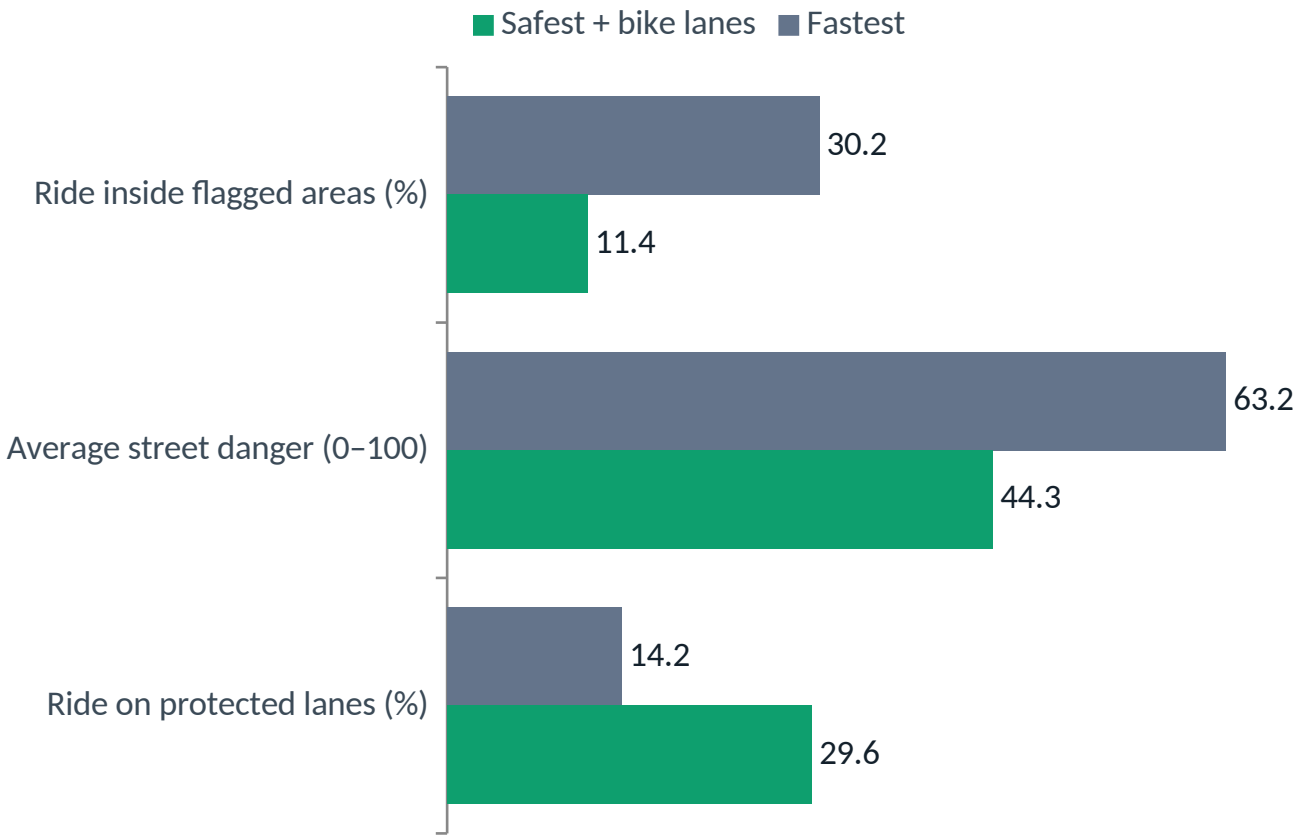

5. **Marina Green → Dolores Park**
   View 3D tour, then Confirm route → navigation

Wi-Fi down? Slides 6–9 show every step

IMPACT

Safer routes cut time in flagged areas by 62%

−62%
time spent inside flagged areas

−30%
average street danger

2.1×
share of the ride on protected lanes

+28%
ride time — the honest cost, shown on every route

Measured through our router on 8 cross-town San Francisco trips, averaged per trip

PRACTICAL

It says what it avoided — and what it cost

Safest + bike lanes

✓ Avoided every Severe area

✓ Avoided every High and Elevated area

✕ Went through 4 crash hotspots (1.3 mi) - no route stays out of all of them

✓ Kept to protected bike lanes where possible

✕ Did not avoid hills

✕ Did not avoid traffic lights

Distance	11.0 mi
Est. time	~96 min
vs fastest route	+26 min
Danger score (avg)	31.9
Worst street on route	76.6
On protected lanes	53%

Rules a rider can read

- Never enters a Severe area
- Avoids High and Elevated areas unless that makes the ride 40%+ longer — then says where and why
- Only claims it "avoided" an area if the fastest route actually goes through it

Avoid hills — Ocean Beach → Ferry Building

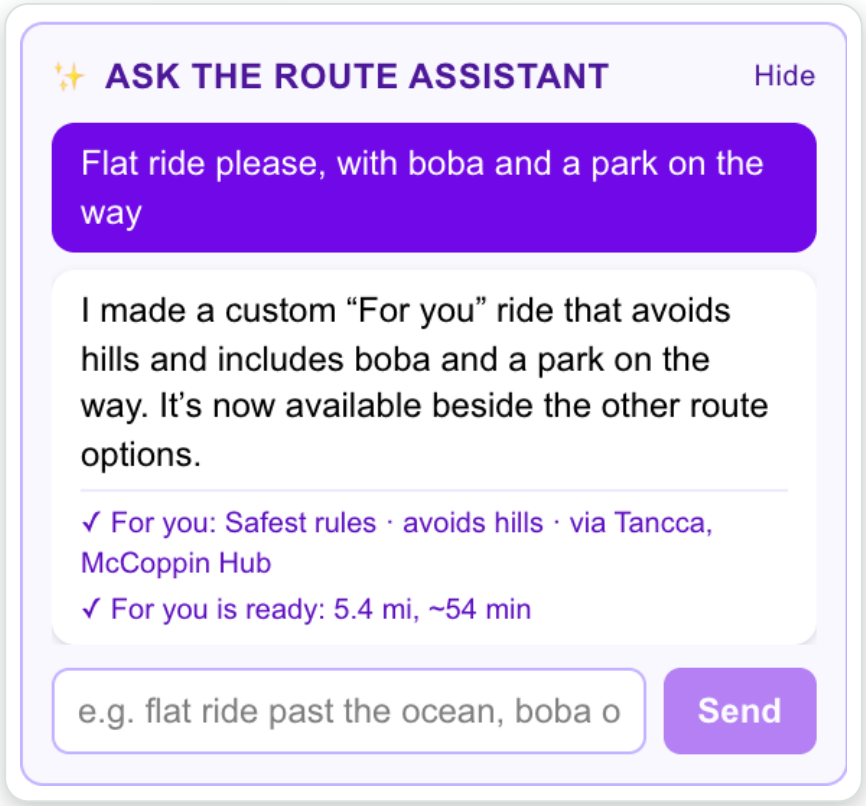

21.8% → 8.6%
steepest climb

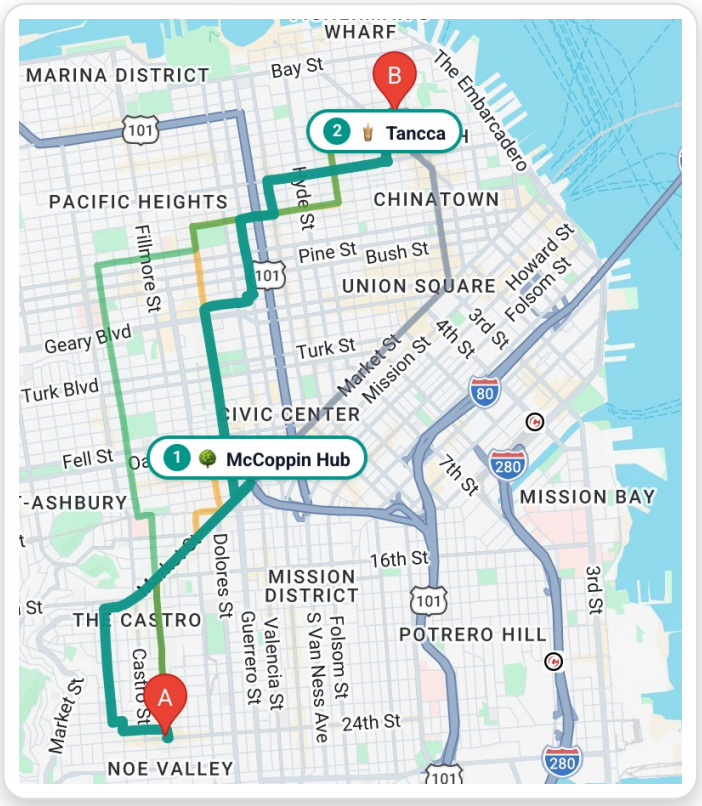

1,027 → 518 ft
total climbing

7 min
quicker, too

CREATIVE

Just say what kind of ride you want

Same controls as you
The AI can't break a safety rule — it can only flip the switches a rider can

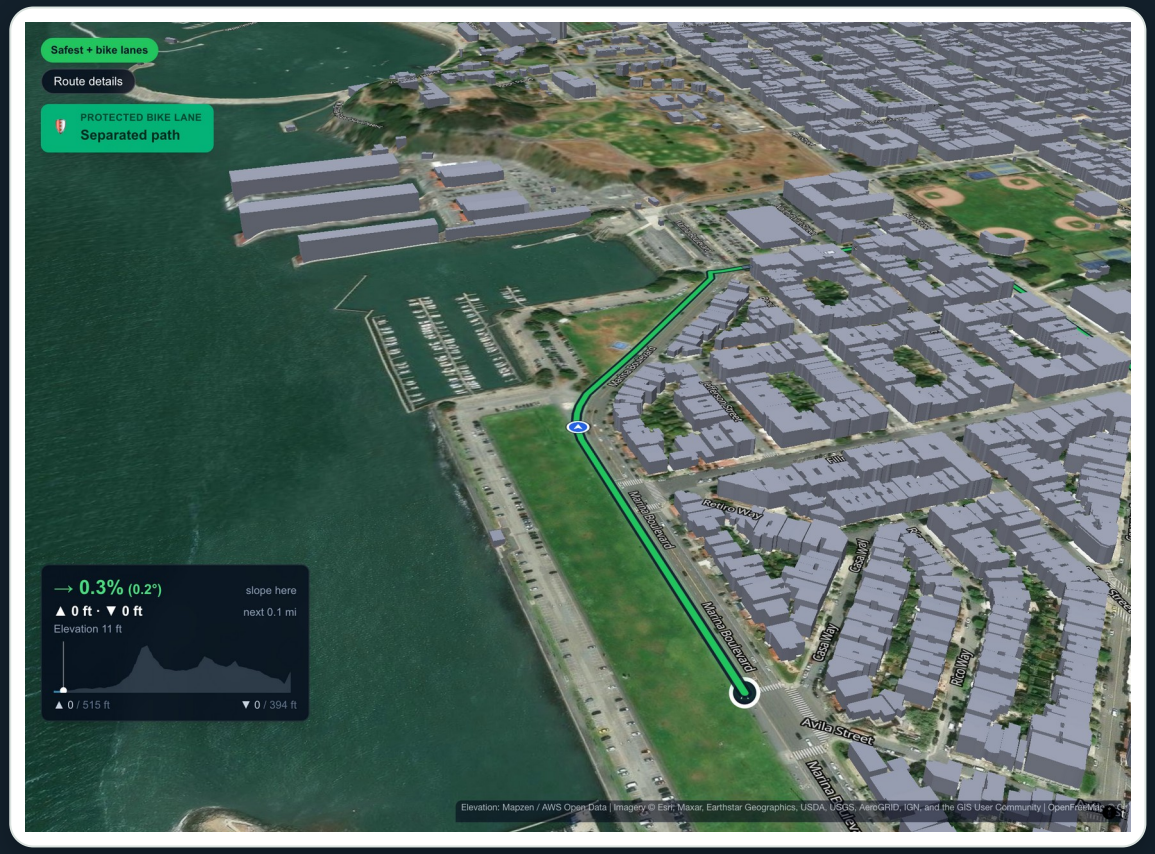

Visible and undoable
Every change it makes shows up in the sidebar

Real places
3,712 spots from OpenStreetMap — never one inside a Severe area

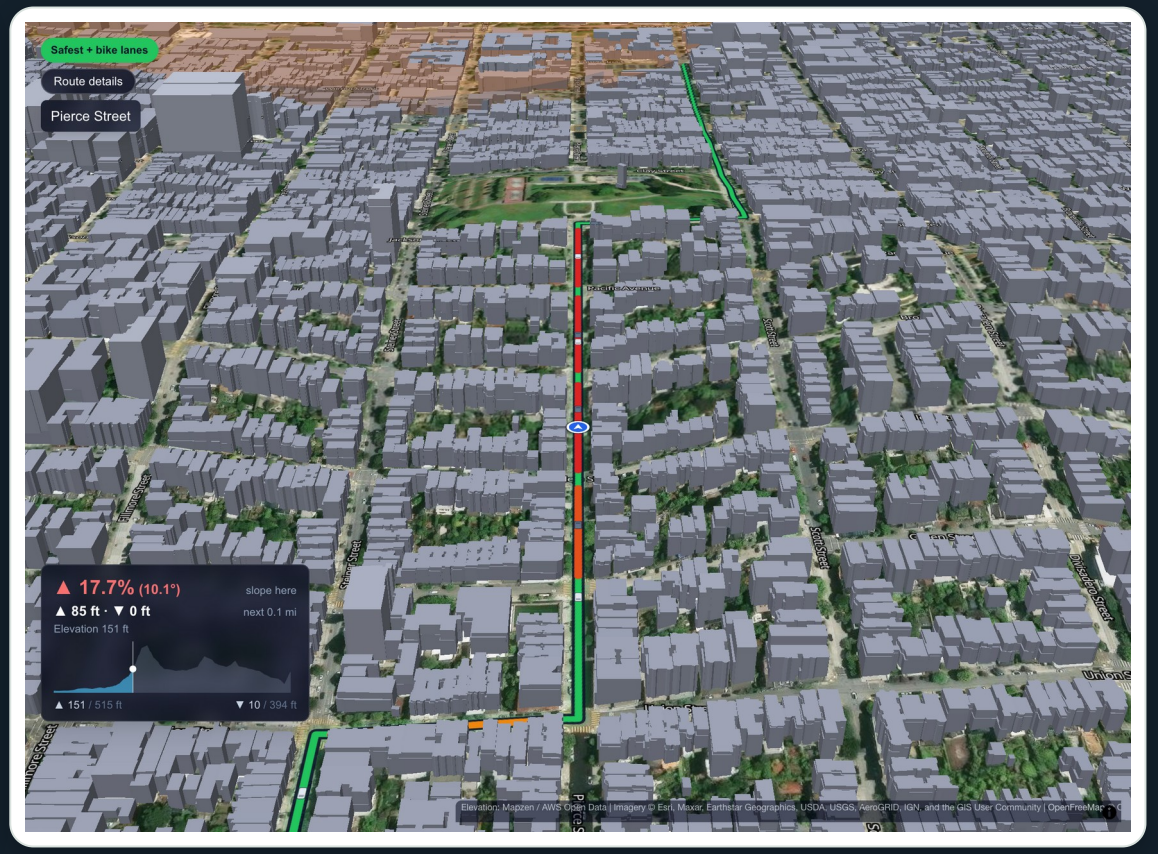

One sentence → a "For you" ride: Safest rules, no big hills, a boba stop and a park, 5.4 mi

CREATIVE

Preview the ride before you ride it

Calls out protected lanes the moment you reach them

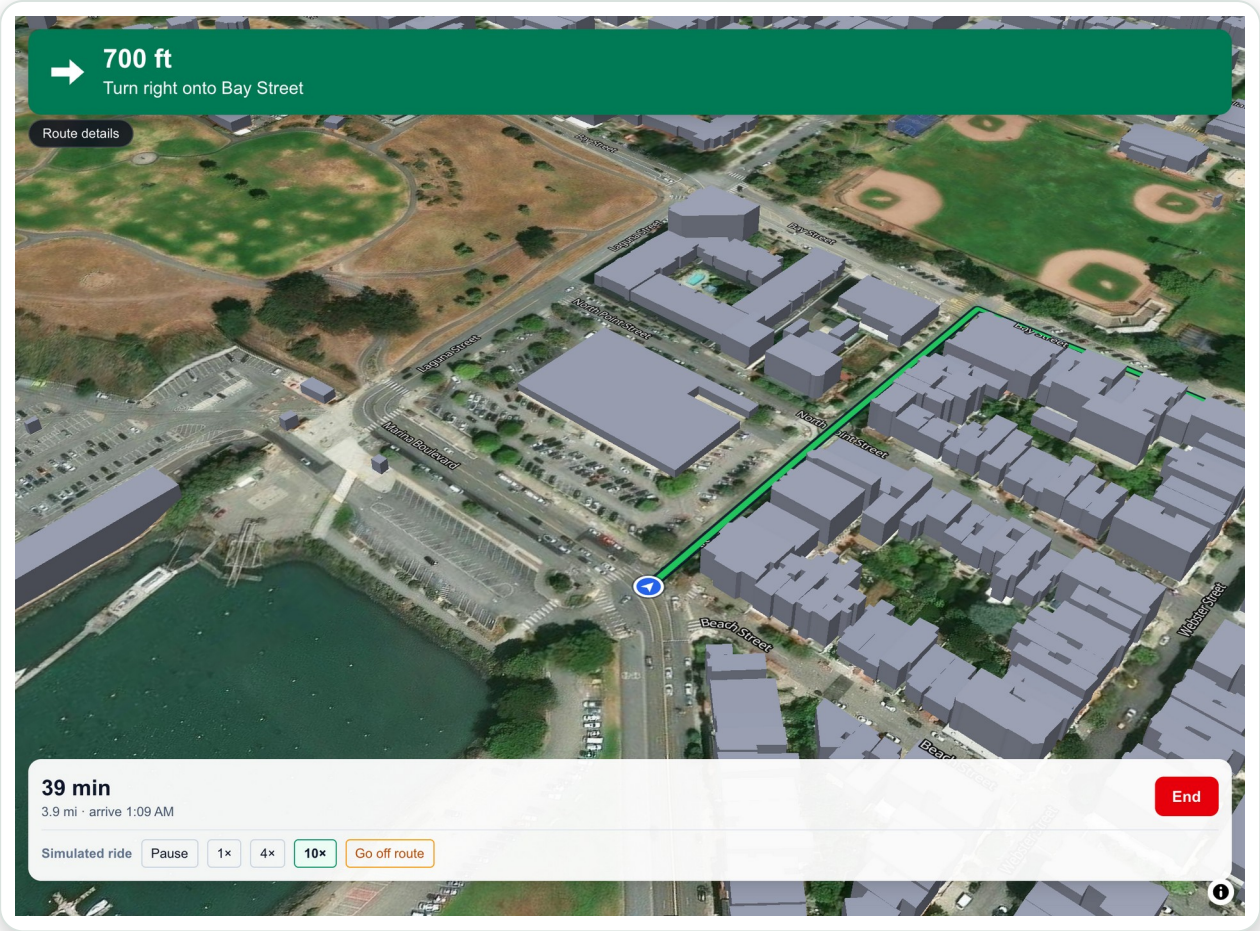

Shows the slope ahead — this block is a 17.7% climb

Real aerial photos · real terrain · San Francisco's own LiDAR building heights

PRACTICAL

From plan to the street

Turn-by-turn with live GPS
Works in a phone browser today

Reroutes keep your choice
Go off route and it still plans the safe way back

Compare side by side
Every stat, one shared hill scale, best value starred

Save rides, add photos
Routes, stops and ride photos kept together

Built like a product — and ready for the next city

411 automated tests, all passing

~0.1 s to plan three routes

6 open datasets, no paid data

What's next

Crash rates, not counts
Adjust for how many people ride each street, and learn area risk instead of hand-setting it

Near-miss reports
Add rider reports (BikeMaps.org) to the crash data

More cities
Any city with open crash and bike-lane data — Vision Zero cities first

Native app
Background GPS and alerts as you approach a danger spot

Safety shouldn't be a setting you have to find

No Roll Models — the safe route, by default, with the trade-offs in plain sight
